The Roly Safeti-Gate is now available in a push button-powered unit.

- The power unit reduces the potential for falls and other accidents associated with Mezzanine pallet loading areas.
- The Gate structure is permanently anchored at the ledge of the Mezzanine.
- The configuration prohibits worker access to the ledge when material is delivered or removed.
- Attached by cables and pulleys in a unique patented way that one gate closes when the other gate opens.
- These heavy-duty units meet OSHA requirements.

POWER MODEL

Controlled with a low-voltage, three-button switch for open, close and stop, the Mezzanine worker steps outside the work station and lowers the rear gate with the press of a button—the ledge gate is automatically opened. The pallets are now able to be brought to or taken away from the pallet drop area by the forklift truck..

After this is done, the ledge gate is closed and the rear gate is automatically opened to allow worker access. A variable pressure setting stops the rear gate and reverses directions if an object is contacted while closing. A controller switch can also be conveniently located on the ground level for remote operation.

An **OPEN** and **SHUT** case for Plant Mezzanine Safety
